

- Types of software testing :

1. Unit testing = Testing individual unit of code to ensure they work as expected.
2. Integration testing = Testing how different unit of code work together.
3. Black box testing = Testing the software without knowledge of the internal working .
4. White box testing = Testing the software with the knowledge of the internal working .
5. system testing = In this testing we can test whole complete application or we say integrated tested is done by testers.
6. User acceptance = Software testing is done in which the software is tested for user acceptance in the client location where software is to be used and ensure that it meets client expectation.
